

ABSTRACT OF THE DISCLOSURE

When an image frame and the kind of ID photograph to make are selected by operating a console, a system controller
5 discriminates a human subject of the image frame from its background, and process image data of the image frame according to the selected kind of ID photograph by deleting any other subject contained in the background and changing the size and position of the human subject such that the
10 human subject is printed on an instant film in a size at a position designated for the selected kind of ID photograph. In accordance with the image data processed by the system controller, an LCD unit is driven to display an image containing the human subject with a blanked background. The
15 image displayed on the LCD unit is observed through a monitoring screen. Upon a printing command, the image displayed on the LCD unit is projected onto the instant film to print that image on the instant film.
